To whom it may concern

Hereby we state that the steel and reinforced concrete structural design of the Sports Complex of Gungoren, Istanbul, has been conducted by İNTAÇ Construction and Engineering successfully.

The structure in question is 35,000 sqm with a free-form like roof design possessing a complex and amorphous contour line. The structural irregularities that have been originated from the idea of dynamic façades, as well as the 30m span length that was covered with a composite slab, were the main challenges for the designer. It should also be noted that the project site is in the 1st degree (i.e. the highest) seismic zone in Istanbul. İNTAÇ Construction and Engineering, on the other hand, have been quite cooperative, timely and successful in handling the challenges of the project and delivering the submittals.
